Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This invention describes novel human transmembrane containing proteins that their encoding nucleic acids. Although no specific use is given for the proteins, they may have a range of activities selected from nutritional uses, cytokine and cell differentiation, immune stimulation/suppression, haematopoiesis regulatory, tissue growth, activin/inhibin, chemostatic/chemokinetic, haemostatic/thrombolytic, receptor/linhibin, tumour inhibitor, anti-inflammatory and other undefined activities. The cDNAs can be utilized as probes for gene diagnosis and as gene sources for gene therapy. The cDNAs can also be used for large scale

This invention describes novel human transmembrane containing proteins and their encoding nucleic acids. Although no specific use is given for the proteins, they may have a range of activities selected from nutritional uses, cytokine and cell differentiation, immune stimulation/suppression, haematopoiesis regulatory, tissue growth, activila/inhibin, chemostatic/chemokinetic, haemostatic/thrombolytic, receptor/lighand, tumour inhibitor, anti-inflammatory and other undefined activities. The CDNAs can be utilized as probes for gene diagnosis and as gene sources for gene therapy. The connected for large scale expression of proteins. The transformed cells can be used for large scale expression of proteins. The transformed cells can be used for detection of the corresponding ligands and for screening of novel low-molecular

cc encoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PR0211 and PR0217 can be used for disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions (e.g. enterocolitis, c. Zollinger-Ellison syndrome, gastrointestinal ulceration and congenital microvillus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial cancers such as lung squamous cell carcinoma of the vulva and gliomas), potent effects on cell growth and development, diseases related to growth or survival of nerve cells can cancer. PR0265 can be used as for fibromodulin, e.g. for reducing dermal cancer. PR0265 can be used as for fibromodulin, e.g. for reducing dermal cancer. PR0265 can be used as a target for anti-tumor drugs. PR0533 may be used in the treatment of Ugher Syndrome or Atrophia areates; PR0530 can be used as an anti-thrombotic agent; PR0287 polypeptides and portions may have therapeutic applications in wound healing and tissue repair; PR0317 can be used for treating problems of the kidney, uterus, endometrium, c.g. blood vessels, or related tissue, e.g. in the heart of genital tract

This invention describes novel human and murine nucleic acids encoding TANGO polypeptides (which are either wholly secreted or transmembrane proteins) which can be used for gene therapy and/or vaccination. The caids may be used to produce TANGO 180 to TANGO 189 and TANGO 215. The nucleic acids may be used to produce TANGO 180 to TANGO 189 and TANGO 215. The nucleic acids may also be used to detect and quantify the presence of TANGO mucleic acids in a sample and therefore identify or diagnose diseases associated with inappropriate TANGO expression (e.g. diseases related to over or under expression of the polypeptides or the expression of inactive polypeptides). The nucleic acids and the polypeptides they encode may be used according to standard gene therapy protocols, to treat diseases associated with inappropriate TANGO expression by supplementing a pastients own production of the polypeptide of to rectify mutations that parties own production of an abnormally active polypeptides and cancagonists of TANGO expression and activity which may be used to identify and producing antibodies to rectify mutations that antiganists of TANGO expression and activity which may be used for inhibiting the activity of TANGO proteins which may be used for inhibiting the presence of TANGO proteins which may be used for inhibiting the activity of TANGO proteins in samples and therefore identify patients in whom the protein is sover- or under-expressed. This sequence represents the human TANGO 186 protein described in the method of the invention
 Isolated nucleic acids encoding TANGO polypeptides useful for preventing, diagnosing and treating diseases associated with inappropriate protein expression.

New human signal peptide-containing proteins useful in treatment, prevention and diagnosis of e.g. cancer, inflammation and cardlovascular disease.

Claim 1; Page 192-193; 327pp; English.

human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have anti-inflammatory, antimicrobial, nootropic, hepatotropic, carticovascular and antiasthmatic activities, and can be anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, carthma, crohn's disease, Alzhenimer's Parkinson's or Huntington's cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, carthma, crohn's disease, Alzhenimer's, Parkinson's or Huntington's diseases, schizophrenia, ovulatory defects, muscular dystrophy). HSPP nucleic acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for detecting HSPP in standard hybridisation and amplification assays (for disponsis and monitoring), in gene therapy, as antisense, triplex-forming or ribozyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping. HSPP are also used to raise

AAY53622-43 represent bone marrow secreted proteins of human bone marrow stromal cells. The proteins can exhibit cytokine, cell proliferation, or cell differentiation activity (either inducing or inhibiting). They can be used to support colony forming cells or factor-dependent cell lines, to regulate hematopoiesis, and to treat myeloid or lymphoid cell and cellideration of erythroid progenitor cells, and to treat various anaemias. They can have colony stimulating factor (CSF) activity and can be used to support the growth and proliferation of myeloid cells such as granulocytes, monocytes or macrophages, to prevent or treat myelo. They can be used to support the growth and proliferation of megakaryocytes and platelets, thereby allowing prevention or treatment of platelet disorders such as thrombocytopenia, to support the growth and coliferation of hematopoeitic stem cells, either in place of or in conjunction with platelet transfusions, to treat stem cell disorders, such as aplastic anaemia and paroxysmal nocturnal hemoglobinuria, or to repopulate the stem cell compartment after irradiation or chemotherapy. They can be used for growth or differentiation of bone, cartilage, tendon, ligament, or nerve tissue, as well as for wound healing and triangles repair and replacement, and in the treatment of plump.
 and ulcers, to induce cartilage and/or bone growth in circumstances where bone is not normally formed and thus have an application in healing bone fractures and cartilage damage or defects, prophylactic use in fracture reduction and also in the improved fixation of artificial joints

The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAA80606A80623 encode the 12 secreted protein sequences given in AAA80606A80623 encode the 12 secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the activities of the proteins include: immunosuppressant; anti-inflammatory; antiarteriosclerotic; anticancer; vulnerary; antiviral; antibacterial; antianteriosclerotic; anticancer; vulnerary; antiviral; antibacterial; antagonists may be used to treat prevent and/or diagnose various disease, discorders and conditions examples of which include: immune disorders e.g. Addison's disease, rheumatoid arthritis, dermatitis, and multiple sclerosis; inflammatory powel disease, cronary disorders e.g. inflammatory bowel disease, cronary disorders e.g. inflammatory bowel disease, cronary arteriosclerosis and mycoarders; and also be used in wound healing and polynucleotide sequences may also be used in wound healing and polynucleotide sequences may also be used in wound healing and protein sequences may also be used in wound healing and protein gene #10 and protein gene #10 and protein gene #10 and protein gene #10 is located on chromosome 12.

Sequences AAB25616 E25618 represent genes which are related to the

 (ZYMO) ZYMOGENETICS INC.
```

```
The invention relates to human Zsigl3 proteins (AAB48972-B48974), and to DNA encoding them (AAG9182-C91784). The invention also relates to expression vectors and host cells comprising a human Zsigl3 DNA, and the recombinant production of a human Zsigl3 protein or its precursor. Zsigl3 is a serine protease, and has significant homology to Bacillus licheniformis glutamyl endopeptidase, human clotting factor X, human elastase, rat mast call protease, Streptomyces griseus trypsin, bovine trypsinogen, and Hypoderma lineatum collagenase. The gene encoding human Zsigl3 is located on chromosome 1122:1. Zsigl3 is useful in industrial processes to degrade unwanted proteins or alter the characteristics of protein-containing compositions. It may also be used in industrial applications in which proteases are utilised, including food processing, brewing and alcohol production, and as a component of a laundry detergent. The present sequence represents a human Zsigl3 variant

 Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals and to screen for modulators of the compounds.
 The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats
 Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation of differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nuclaic acids can be used for genetic analysis of individuals with genetic disorders

The invention relates to human PRO polypeptides (secreted or transmembrane polypeptides) and the polynucleotides encoding them. The PRO polypeptides and polynucleotides can be used in treating pathological disorders and tumours, in therapeutic treatment of cardiac insufficiency disorders and tumours, in therapeutic treatment of asorders involving pathological secretion by the pancreas, including disbetes. They can also be used in treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal casions, and skin diseases associated with abnormal keratinocyte differentiation (e.g., psoriases, epitholial cancers such as lung squamous cell carcinoma, epitholial carcinoma of the vulva and gliomas). The sequences can be used as molecular markers for protein celectrophoresis purposes and can be utilised in protein-protein binding assays, biochemical screening assays, immunoassays and cell-based assays. This sequence represents a human PRO polypeptide of the invention
 Isolated nucleic acid useful for e.g., treating pathological disorders encodes a secreted or transmembrane protein.
